

Interim Management's Discussion and Analysis
Quarterly Highlights
For the Nine Months Ended September 30, 2021

INTRODUCTION

Canasil Resources Inc. ("Canasil" or the "Company") is a mineral exploration company listed under the trading symbol "CLZ" on the TSX Venture Exchange. The Company is engaged in the exploration and development of mineral properties with prospects for silver, gold, copper, zinc and lead in Durango and Zacatecas States, Mexico, and in British Columbia, Canada. The Company's project portfolio includes six silver-focused projects in Mexico, and four projects in British Columbia, two of which are prospective for hosting copper-gold porphyry mineralized systems.

This Interim Management's Discussion and Analysis ("MD&A") is dated November 25, 2021, and provides information on the Company's activities for the nine months ended September 30, 2021, and subsequent activity to the date of this report. Consequently, this MD&A should be read in conjunction with the Company's September 30, 2021 condensed interim consolidated financial statements, prepared in accordance with International Financial Reporting Standards ("IFRS") as issued by the International Accounting Standards Board.

The Company has elected to provide interim MD&A disclosure under the "Quarterly Highlights" regime as set out in Section 2.2.1 of National Instrument 51-102F1. Discussion of the Company, its operations and associated risks is further described in the Company's filings, which include the December 31, 2020 MD&A and audited consolidated financial statements, available for viewing at www.sedar.com.

HIGHLIGHTS

Highlights of the Company's activities during the period under review are as follows:

- completed a drill program at the La Esperanza project in Mexico;
- completed and filed an updated technical report on the Brenda project in BC, Canada;
- reviewed project data, prepared plans and targets, and completed a four-hole 932-metre Phase-2 drill program at the Nora project in Mexico;
- initiated a comprehensive data review of the Vega project in BC, Canada;
- completed a non-brokered private placement for gross proceeds of \$790,000 in May 2021;
- issued 850,000 shares for proceeds of \$102,000 upon the exercise of warrants in October 2021;
- completed a non-brokered private placement for gross proceeds of \$708,750 in November 2021, which includes \$165,000 of flow-through financing;
- completed a limited induced polarization ("IP") survey at the Vega project; and
- commenced a Phase-3 drill program at the Nora project in November 2021.

Further information regarding the Company's corporate and exploration activities is provided below.

OUTLOOK

Past exploration programs have identified prospective targets for further exploration and drilling on the Company's project portfolio in Mexico and in British Columbia, Canada. They have also returned encouraging drill results, particularly from the La Esperanza high-grade silver-gold-zinc-lead project and the Nora silver-gold-copper project in Durango and Zacatecas States, Mexico. In the second half of 2020 and first half of 2021 the Company completed an initial drill program at the Nora project and a follow-up drill program at the La Esperanza project. Both drill programs have returned encouraging results confirming the potential for further drill testing and details are noted below in the mineral property section. In July 2021 the Company completed a follow-up drill program at the Nora project with further encouraging results. The Company also completed an updated Technical Report on the Brenda project in BC, Canada, which indicated encouraging prospective drill targets.

Significant exploration plans are contingent on adequate funding to carry out drilling and other programs and maintain sufficient operating working capital. In March 2020, the Company completed a private placement of \$407,000 to fund the start of drilling on its high-grade silver-gold projects in Mexico. Following delays due to the COVID-19 outbreak, the Company commenced the maiden drill program at the Nora project in early July 2020. The Company also completed a private placement of \$1,565,500 in July 2020, which allowed for additional drilling at both the Nora and La Esperanza projects. An initial program of 1,744 metres at the Nora project, and a follow-up drill program of 1,879 metres at the La Esperanza project were completed during the second half of 2020 and first half of 2021 with encouraging results. A private placement of \$790,000 was completed in May 2021 and a follow-up drill program was completed at the Nora project in July 2021 with four drill holes for a total of 932 metres. All four holes returned high grade silver-gold intercepts. In October and November 2021, the Company received \$102,000 from the exercise of warrants, arranged a private placement of \$708,750 and started a Phase-3 drill program at the Nora project.

Market Conditions

From mid-June 2019 to early August 2020, gold and silver prices increased significantly; gold from US\$1,340 per ounce to a high of over US\$2,050 per ounce and silver from US\$15 per ounce to US\$29 per ounce. As a result of the COVID-19 pandemic, in early March 2020 both gold and silver prices initially dropped sharply trading down to US\$1,471 per ounce for gold and US\$11.94 per ounce for silver, recovering to the high levels noted above by August 2020. Since then, over the past year, in spite of significant economic stimulus measures, both gold and silver prices have been volatile, with gold trading between US\$1,690 and US\$1,950 per ounce, and silver between US\$21.50 and US\$28.50 per ounce. From June to late September 2021, gold and silver prices progressively dropped to US\$1,725 and US\$21.50 per ounce, respectively. Both gold and silver prices have recently started to move higher with gold closing at US\$1,788 per ounce and silver US\$23.57 per ounce at the date of this report. The gold-silver price ratio has moved to 76 at the time of this report. Copper and zinc prices were also volatile during 2021 to date, increasing to US\$4.80 per pound and US\$1.38 per pound, respectively, and closing at US\$4.33 per pound and US\$1.50 per pound at the date of this report, with copper well over US\$3.20 per pound but zinc still below US\$1.60 per pound in January 2018.

The overall improvement in gold and silver prices since mid-June 2019 has provided better market conditions for both the larger mining companies as well as for the earlier stage exploration companies, leading to significant funding opportunities since early 2020. However, the volatility in gold and silver prices since August 2020 have resulted in generally lower share prices and market interest both for larger producers and smaller exploration companies resulting in a more challenging funding environment.

Impact of COVID-19 pandemic

The Company's exploration activities were stopped from March to June 2020 due to the COVID outbreak. In early July 2020, field operations resumed in Mexico with the drill program at the Nora project followed by the drill program at La Esperanza, although with operating challenges due to COVID constraints. All administrative and technical activities have continued uninterrupted. During the period, the Company focused on advancing the drill program at the La Esperanza project, completing the private placements in May and November 2021, completion of the follow-up Nora drill program in July 2021, and subsequent resumption of drilling at Nora in November 2021.

The Company's personnel continue to comply with the respective government directives and emergency orders, and also to take maximum precautions for the safety of local communities, contractors and themselves and in order to prevent the spread of the COVID-19 infection, particularly now with the increase in new more infectious variants.

Canasil Resources Inc. - Interim Management's Discussion and Analysis
Quarterly Highlights for the Nine Months Ended September 30, 2021

FINANCIAL CONDITION

As at September 30, 2021, the Company had working capital of \$237,549 compared to working capital of \$913,694 at December 31, 2020. The reduction in working capital results from the Company's cash used in operating activities for the period exceeding the funds provided by investing and financing activities. The Company's working capital consisted of the following:

	September 30, 2021	December 31, 2020
Cash and cash equivalents	\$ 136,721	\$ 926,340
Receivables	138,906	93,519
Prepaid expenses	30,274	24,502
Accounts payable and accrued liabilities	(68,352)	(96,413)
Current portion of lease liability	-	(34,254)
Working capital position	\$ 237,549	\$ 913,694

Liquidity and Financial Resources

The Company has no income from operations and is dependent upon raising funds through the issuance of shares or disposing of interests in its mineral properties (by option, joint venture or outright sale) to finance acquisitions, exploration and development of mineral properties, and meet general and administrative expenses. Accordingly, as discussed in Note 1 to the September 30, 2021 condensed interim consolidated financial statements, management has identified certain conditions that cast significant doubt upon the Company's ability to continue as a going concern.

During the current period, the Company incurred expenses, net of non-cash items, of \$1,460,685, which included administrative expenses of \$431,337 and exploration and evaluation expenses of \$1,029,348. The administrative budget and exploration and land holding budgets for each of the Company's properties are established depending on expected cash resources and such budgets are regularly adjusted according to actual cash resources.

The Company completed private placements for gross proceeds of \$790,000 in May 2021 and \$708,750 in November 2021. In October 2021, the Company received proceeds of \$102,000 upon the exercise of warrants. Under the terms of its flow-through agreements, the Company is required to incur \$165,000 in qualifying exploration expenditures by December 31, 2022. Management of the Company considers its current working capital to be insufficient to meet its budgeted overhead and planned exploration and land holding requirements for the ensuing twelve months. In the long-term there can be no assurance that the Company will be successful in securing the financing required to continue operations and advance its mineral projects.

While the Company has been successful in completing recent financings and its drill programs at Nora and La Esperanza, the ongoing COVID-19 pandemic has had an effect on the Company's ability to conduct its exploration activities and may affect its ability to raise additional funding in the future.

FINANCIAL PERFORMANCE

Loss and comprehensive loss

The Company's loss and comprehensive loss for the current and comparative quarters includes the following:

	2021	2020
General and administrative expenses	\$ 149,809	\$ 178,775
Exploration and evaluation expenditures	311,377	474,805
Loss and comprehensive loss for the quarter	\$ 461,186	\$ 653,580

General and administrative expenses for the current quarter are lower than the comparative quarter due mostly to a decrease in investor relations and promotional costs. Exploration and evaluation expenditures are also lower in the current quarter primarily due to the timing of the payment of claim fees made on the Mexican properties, which were higher in the comparative quarter.

Canasil Resources Inc. - Interim Management's Discussion and Analysis
Quarterly Highlights for the Nine Months Ended September 30, 2021

The Company's loss and comprehensive loss for the current and comparative nine-month periods includes the following:

	2021	2020
General and administrative expenses	\$ 608,175	\$ 587,464
Exploration and evaluation expenditures	1,029,348	782,729
Gain on sale of equipment	(6,983)	-
Loss and comprehensive loss for the period	\$ 1,630,540	\$ 1,370,193

General and administrative expenses for the current period are slightly higher than the comparative period due to an increase in share-based compensation, a non-cash item, offset by lower investor relations costs and management fees. The increase in exploration and evaluation expenditures for the current period is due primarily to drilling and related costs incurred at the La Esperanza project, which were not incurred in the comparative period.

Cash Flows

The main components of the Company's cash flows for the current and comparative nine-month periods include the following:

	2021	2020
General and administrative expenses	\$ (431,337)	\$ (462,035)
Exploration and evaluation expenses	(1,029,348)	(782,729)
Changes in non-cash working capital items	(79,220)	28,011
Purchase of equipment	(2,043)	(4,531)
Proceeds on sale of equipment	6,983	-
Principal payments on lease liability	(34,254)	(29,330)
Share capital issued for cash	779,600	1,928,850
	\$ (789,619)	\$ 678,236

The increase in cash used in operations is due to the increase in exploration and evaluation expenses as detailed above. Changes in non-cash working capital items for the current period resulted from an increase in value-added tax receivable in Mexico and a reduction in accounts payable. The Company completed a private placement for net proceeds of \$779,600 in May 2021; in the comparative period, the Company completed private placements for net proceeds of \$397,306 in March 2020 and \$1,531,544 in July 2020.

MAJOR OPERATING MILESTONES

During the period under review, the Company completed two private placements for gross proceeds of \$1,498,750 received \$102,000 upon the exercise of warrants, completed drill programs at the Nora and La Esperanza projects, filed an updated technical report on the Brenda project, conducted a limited IP survey at the Vega project, and commenced a Phase-3 drill program at the Nora project.

RELATED PARTY TRANSACTIONS AND KEY MANAGEMENT COMPENSATION

The Company relies heavily on its directors and officers for many of its administrative and professional services. Key management includes executive and non-executive directors and officers. The compensation paid or payable to key management for the periods ended September 30 is as follows:

	2021	2020
Salaries – chief executive officer	\$ 168,750	\$ 168,750
Management fees – chief financial officer	45,000	72,500
Director fees	27,000	27,000
	\$ 240,750	\$ 268,250

In addition, the Company recorded share-based compensation of \$77,913 (2020 - \$48,204), which relates to incentive stock options granted to directors and officers. Share-based compensation is a non-cash item calculated using the Black-Scholes Option-Pricing Model with the assumptions detailed in Note 5 to the Company's September 30, 2021 condensed interim consolidated financial statements.

Canasil Resources Inc. - Interim Management's Discussion and Analysis
Quarterly Highlights for the Nine Months Ended September 30, 2021

OUTSTANDING SHARE DATA

A summary of the Company's outstanding shares, options, and warrants is as follows:

	November 25, 2021	September 30, 2021	December 31, 2020
Shares issued and outstanding	131,671,622	125,371,622	117,471,622
Outstanding stock options	10,590,000	10,590,000	8,890,000
Outstanding warrants	14,276,250	12,951,250	9,001,250
Diluted shares outstanding	156,537,872	148,912,872	135,362,872

During the period the Company granted 200,000 stock options that vest over a period of twelve months and 1,900,000 options that vested immediately; 400,000 options expired unexercised. In May 2021, the Company completed a non-brokered private placement of 7,900,000 units that included one common share of the Company and one-half of one share purchase warrant. In October 2021, the Company issued 850,000 shares upon the exercise of warrants. In November 2021, the Company completed a non-brokered private placement of 1,100,000 flow-through shares and 4,350,000 non-flow-through units that included one common share of the Company and one-half of one share purchase warrant.

Notes 4 and 5 to the Company's September 30, 2021 condensed interim consolidated financial statements provide additional details regarding share capital, stock option, and warrant activity for the period.

MINERAL PROPERTY SUMMARY

The Company holds the following mineral exploration projects in Mexico and Canada:

<p>Durango and Zacatecas, Mexico:</p> <ul style="list-style-type: none"> • La Esperanza silver-gold-zinc-lead project – 100% • Salamandra zinc-silver project – 100% • Nora silver-gold-copper project – 100% • Colibri silver-zinc-lead-copper project – 100% • Vizcaino silver-gold project – 100% • Carina silver project – 100% 	<p>British Columbia, Canada:</p> <ul style="list-style-type: none"> • Brenda, gold-copper property – 100% • Vega, gold-copper property – 100% • Granite, gold property – 100% • LIL, silver property – 100%
--	--

La Esperanza

The La Esperanza silver-gold-zinc-lead project covers 14,916 hectares spanning the border of Durango and Zacatecas States, 100 kilometres south-southeast of the City of Durango. The project is located in a prolific mining district on the important Fresnillo silver trend, 80 kilometres northwest of the Fresnillo mine, and approximately 35 kilometres from Pan American Silver's La Colorada mine, and First Majestic Silver's La Parrilla and Del Toro mines. Systematic and comprehensive exploration programs to date have included satellite imaging and high-resolution mapping, 1,330 line-kilometre ZTEM airborne geophysical survey, extensive geological mapping and sampling and over 11,500 metres of drilling in 44 diamond drill holes. Drilling has returned wide high-grade silver-gold-lead-zinc intercepts from the La Esperanza vein, located in the southeast of the project area that is open in all directions (announced in past news releases). Additional occurrences of silver-lead-zinc vein mineralization have also been identified in the northwest of the project area. Two of these have been tested with initial drill programs, which indicated potential for significant silver-lead-zinc mineralization.

Results of drill programs on the La Esperanza vein confirmed a mineralized envelope of 525 metres ("m") along strike and 350 m to depth. Significant drill intercepts reported in past news releases include:

- ES-06-05 in the central section returned 13.10 m (true width ("TW") - 10.30 m) of 396 g/t silver ("Ag"), 0.71% zinc ("Zn") and 1.96% lead ("Pb"), including 1.93 m (TW 1.52 m) of 1,380 g/t Ag, 0.38% Zn and 3.40% Pb.
- ES-17-16 in the southeast extension returned 5.94 m (TW 4.92 m) of 257 g/t Ag, 0.64% Zn and 0.63% Pb, including 1.15 m (TW 0.95 m) 1,133 g/t Ag, 1.56% Zn and 2.98% Pb.
- ES-17-17 in the northwest extension returned three separate hanging wall vein intercepts followed by the main vein and a footwall vein. The main vein returned an intercept of 6.71 m (TW 5.81 m) of 204 g/t Ag, 1.83% Zn, and 1.46% Pb, including 0.91 m (TW 0.79 m) of 347 g/t Ag, 2.98% Zn and 2.20% Pb.
- ES-17-19, intercepted the vein below ES-17-17 with 12.97 m (TW 11.23 m) of 219 g/t Ag, 0.93% Zn and 0.43% Pb, including 1.28 m (TW 1.11 m) of 6.39 g/t gold ("Au"), 1,281 g/t Ag, 2.23% Zn and 1.25% Pb.

Canasil Resources Inc. - Interim Management's Discussion and Analysis
Quarterly Highlights for the Nine Months Ended September 30, 2021

This was the highest gold value recorded to date from the La Esperanza vein together with high silver values.

These results open the La Esperanza vein for further expansion by drilling in both directions along strike and to depth in a well-developed epithermal environment. Continued drilling will be focused along strike and below drill holes ES-17-17 and ES-17-19 in the northwest, and along strike and below drill holes ES-17-16 and ES-18-21 in the southeast.

Six core drill holes were completed in late 2020 and early 2021 for a total of 1,879 metres targeting the southeast and northwest extensions of the La Esperanza vein. Three holes in the southeast extension returned wide altered and mineralized intercepts with narrow higher-grade bands, as shown in the table and long section below. Three drill holes targeted the northwest extension; two of the drill holes were lost short of the target zone in crossing fault zones due to difficulties resulting from drilling only one shift due to COVID-19 constraints. The third hole intersected a wide altered structure, interpreted as the upper levels of the vein structure. The multiple altered and mineralized intercepts confirm a strong mineralizing environment, and are encouraging indicators for continued drilling.

The La Esperanza vein is exposed on surface for 200 m, and has now been extended by drilling under volcanic cover for an additional 325 m for a total strike of 525 m, and is traceable by geophysics for over five kilometers along a NW-SE trend. Drilling to date has defined the La Esperanza vein to a depth of 350 m, in a region where epithermal vein mineralization at the neighbouring La Colorada mine is noted down to 1,000 m below surface underlain by skarn mineralization to a depth of over 1,800 m.

Fig. 1: La Esperanza Vein Long Section With 2020-21 Drill Hole Locations

Nora

The Nora project is located approximately 200 kilometers north-west of the City of Durango, with good access and infrastructure. There are two principal epithermal vein outcrops at the Nora project, the Candy and Nora veins. The Candy vein has been traced for approximately 750 metres at surface through pits and trenches from historical mining activity, and discontinuous outcrops. Mineralization is found adjacent to a fault structure that has been traced over three kilometers along strike. Historical mining activity on the Candy vein included a 115-metre-long adit and a short cross-cut that exposed the vein approximately 50 metres below surface. Samples of vein outcrop and mineral dumps from the Candy vein returned significant gold, silver, copper, zinc and lead values. The highest-grade sample of outcropping vein returned 1.00 metre with 1.98 g/t Au, 514 g/t Ag, 1.03% Cu, 3.28% Zn and 4.45% Pb, and the highest grab sample collected from waste piles (“dumps”) returned 1.34 g/t Au, 293 g/t Ag, 0.47% Cu, 0.38% Zn and 9.27% Pb. The second Nora vein is found 600 metres northeast of the Candy vein and can be traced for 230 metres along strike with widths of over 9.0 metres. Surface samples from this vein contained trace sulphides.

Soil samples collected along a grid covering the area surrounding the Candy and Nora veins and projected extensions over an area of three kilometers by two kilometers return elevated silver, base metal (copper, lead and zinc) and pathfinder (molybdenum and arsenic) values over a large area. The combination of the vein outcrops with large areas of anomalous silver and base metal values in soil samples may indicate a larger buried mineralized system at depth. In 2019 the Candy and Nora vein outcrops were sampled to define drill targets over a strike distance of 918 metres on the Candy vein and 160 metres on the Nora vein. Samples from the Candy vein outcrops returned consistently high silver, gold, copper, zinc and lead values. The Nora vein samples returned anomalous silver values and contained trace sulphides and a geochemical signature typical of the higher levels of an epithermal vein system.

The 2020 Phase-1 drill program included six core drill holes along four sections of the Candy vein over a strike distance of 500 metres, and two drill holes to test the Nora vein, for a total of eight drill holes and 1,744 metres.

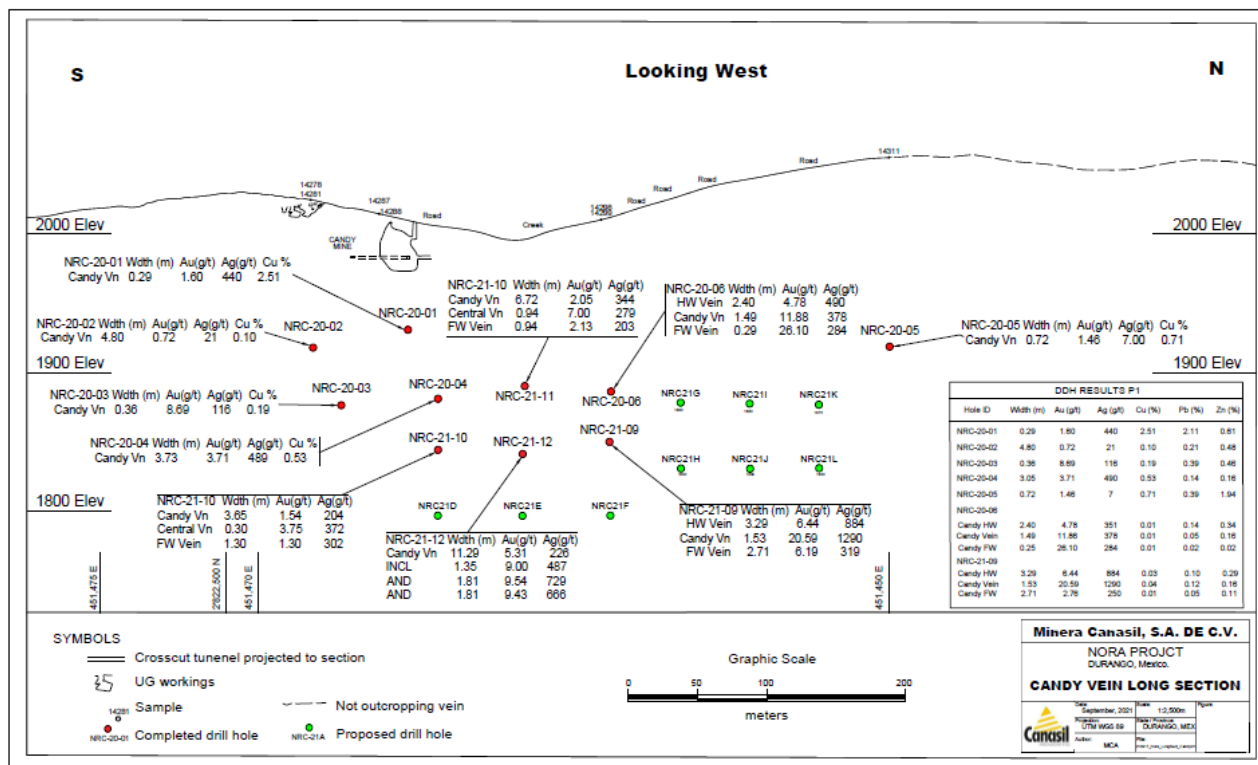

Canasil Resources Inc. - Interim Management's Discussion and Analysis
Quarterly Highlights for the Nine Months Ended September 30, 2021

Results from the Candy vein were very encouraging with all six drill holes consistently intersecting significant gold-silver mineralization, and high-grade intercepts from drill holes NRC-20-04 and NRC-20-06, reported on October 24 and December 9, 2020.

The 2021 Phase-2 drill program was completed in July 2021 and included four core drill holes for a total of 932 metres, targeting the area below and in between NRC-20-06 and NRC-20-04. All four drill holes intersected the Candy vein on target, confirming vein structures which are wider, higher grade, and with more mineralized intercepts with depth than the 2020 drill intercepts. The high gold and silver grades and relatively low base metal values suggest the upper levels of the system, which is open to depth. The results from the 2021 Phase-2 drill program are included in the table and the long section below for reference:

Candy Vein Long Section - 2020 and 2021 Drill Intercepts

Salamandra

The Salamandra zinc-silver project is located in Durango State, 35 kilometres northeast of the City of Durango, with excellent access by paved and gravel roads. The project area covers 14,719 hectares and was acquired through staking of claims and the purchase of a 100% interest in the central 900 hectares within the project area, subject to a 0.5% NSR that can be purchased from the owner for US\$500,000.

Past exploration by Canasil at Salamandra includes geological mapping and surface sampling, 3D-IP ground geophysics, ZTEM airborne geophysics and twelve diamond drill holes for a total of 3,595 metres. In May 2013, the Company signed an option agreement with MAG Silver Corp. (MAG) providing the right to earn up to a 70% interest in the property. In February 2016, MAG withdrew from the agreement and Canasil retains a 100% interest in the project.

MAG spent \$5.8 million on exploration programs which included surface sampling, data review, and satellite imaging in 2013, followed by three phases of diamond drilling programs for a total of 14,382 metres in 23 drill holes between 2013 and 2015. The surface sampling and data review identified indications of large replacement deposits at Salamandra. The drill programs reported encouraging high-grade silver-copper-zinc intercepts, pervasive zinc mineralization, and an interesting interval of gold-tungsten mineralization.

Past drill intercepts of particular note at the Salamandra project are; SA-07-02 from 7.40 metres to 17.25 metres, an interval of 9.85 metres of 102 g/t Ag and 0.55% Zn, and from 27.65 metres to 35.10 metres, an interval of 7.45 metres with 50 g/t Ag, 12.00% Zn, and 0.22% Cu. Drill hole SA-07-03 returned 10.00 metres of 71 g/t Ag, 3.48% Zn, and 1.26% Pb. Drill hole SA-13-13 carried low grade zinc mineralization throughout an interval of 810.16 metres with 0.60% Zn, including 31.72 metres of 3.60% Zn. SA-14-15 returned 7.89 metres of 166 g/t Ag, 1.20% Zn, 1.2% Cu, and 0.60% Pb, including 2.30 metres of 393 g/t Ag, 2.8% Zn, 3.6% Cu, 0.40% Pb. These results have been reported in the Company's prior news releases dated 18 July, 2007, 17 March, 2014, and 21 July, 2014.

Salamandra hosts an extensive, complex system with a strong metals endowment. Pervasive zinc mineralization intersected in most of the drill holes, the high-grade silver-copper intercepts and deeper gold and tungsten intercepts indicate the potential for a large metalliferous system at Salamandra. This system remains open and requires additional drilling.

Sandra-Escobar

The Sandra-Escobar property covers over 6,970 hectares located 200 kilometers northwest of the city of Durango, Mexico. In January 2017, Orex Minerals Inc. ("Orex") earned a 55% interest in the project by paying the Company \$500,000 and incurring exploration expenditures of US\$2,000,000. On June 28, 2019, the Company sold its 45% interest in Sandra-Escobar to Pan American Silver Corp. ("Pan American") for \$2,000,000 plus a 2% NSR Royalty Interest on Pan American's interest in the project. Pan American has the right to buy out 1% of the NSR for \$4,000,000. The project is currently being advanced jointly by Pan American (60%) and Orex (40%).

Brenda

The Brenda gold-copper project covers 4,450 hectares (44.5 sq. km.), located in north-central British Columbia, 25km northwest of Centerra Gold's former Kemess South mine and 15km northwest of the proposed Kemess Underground mine and Kemess East deposit, in a region recognized for hosting porphyry gold and copper deposits. Systematic exploration programs on the Brenda project have included geological mapping and surface sampling, satellite surveys, airborne and ground geophysics, 12,067 metres of diamond drilling in 65 holes, and petrographic studies of drill core samples. These programs have identified and intersected widespread porphyry gold-copper style mineralization.

Mineralization observed to date is characterized by drill holes BR-07-04 and BR-07-05 returning broad gold-copper mineralized zones with increasing grades to a depth of 560 metres, with the average grade of five intercepts above a depth of 450 metres returning 0.48 g/t gold and 0.079% copper over a combined intercept length of 394 metres; the average grade of three intercepts below 450 metres returned 0.68 g/t gold and 0.116% copper over a combined intercept length of 93 metres. The mineralized system averages 300 to 400 metres in width and has been traced along a strike length of 400 metres by drilling, with a potential strike length in excess of 1,000 metres when including the chargeability anomalies observed in a 3-Dimensional IP geophysical survey.

The Company undertook comprehensive technical reviews of the Brenda project data between 2016 and 2020. These reviews included three-dimensional geological modelling of the central White Pass zone, identification of prospective targets based on analysis of surface and downhole geochemical data using the porphyry elemental zoning model of Halley et al. (2015)¹ and applying the MDRO Porphyry Index or MPIx (Bouzari et al., 2019)², to vector towards higher grade Cu-Au mineralization. An updated NI 43-101 Technical Report was completed and filed on February 10, 2021. The Technical Report highlights include:

- The Brenda project is a Cu-Au±Mo porphyry system with potentially elevated gold and copper grades due to reactive intermediate to mafic host rocks cut by high-K calc-alkalic intrusions similar to those at important porphyry deposits worldwide.
- Modelling of the central White Pass zone, tested by 41 drill holes (10,034 metres), outlines a Mineralized Zone (MZ) characterized by drill intercepts of >0.1 g/t Au with approximate dimensions of 1,000 m by 400 m and from 100-600 m thick. A Higher-Grade Zone (HGZ) of >0.4 g/t Au has estimated dimensions of 200 m by 300 m and 150 m thick. Three-dimensional shapes for the MZ and HGZ were generated in similar fashion to that of grade shell interpolation using Leapfrog Geo.
- Multiple targets for additional copper-gold mineralization exist northeast, southeast, southwest and east of the Mineralized Zone. Multiple chargeability anomalies, just below the current shapes for the MZ and HGZ and to the northeast and southwest, as well as Au and Cu soil anomalies to the southeast and east have not been drill tested and are recommended for future exploration and drilling. Maps outlining the MZ and prospective target areas are included below for reference.
- The modelling also identified several gaps between mineralized intervals from past drilling. Targeted infill drilling may connect some of the existing higher-grade intervals thereby expanding the dimensions of the HGZ.
- The Project has excellent road access with a fully equipped exploration camp. Proximity to Centerra Gold Inc.'s (Centerra Gold) former Kemess South mine infrastructure, fully permitted proposed Kemess Underground mine, and Benchmark Metals Lawyers project are important advantages.

The Brenda project remains an attractive prospect based on the results to date, excellent road access and proximity to Kemess with its advanced infrastructure including power grid and mining facilities.

***Canasil Resources Inc. - Interim Management's Discussion and Analysis
Quarterly Highlights for the Nine Months Ended September 30, 2021***

The report titled "NI 43-101 Technical Report on the Brenda Gold-Copper Project" dated February 3, 2021 (the "Technical Report") is available on SEDAR (www.sedar.com), and on the Company's website (www.canasil.com). The Technical Report was prepared for Canasil by Robert A. (Bob) Lane, M.Sc., P. Geo., of Plateau Minerals Corp. Mr. Lane is a Qualified Person as defined under National Instrument 43-101 of the Canadian Securities Administrators - *Standards of Disclosure for Mineral Projects*.

¹ Halley, S., Dilles, J.H., and Tosdal, R.M., 2015, Footprints: Hydrothermal alteration and geochemical dispersion around porphyry copper deposits: SEG Newsletter, no. 100, p. 1, 12-17.

² Bouzari, F., Bissig, T., Hart, C.J.R., and Leal-Meija, H., 2019, An exploration framework for porphyry to epithermal transitions in the Toodoggone mineral district (94E): Geoscience BC Report 2019-18, 105 p.

Vega

The Vega project is located in north-central British Columbia, approximately 300 kilometres northwest of Prince George, BC, with access via the Omineca Mines Access Road and logging roads. The project covers 9,002 hectares on the Quesnel trough trend running through central British Columbia and hosting the Mount Milligan, Chuchi, Kwanika, Lorraine and Cat porphyry deposits. There are several showings in the eastern and western sectors of the Vega property prospective for hosting copper-gold porphyry mineralization. Most of the past exploration work done by Canasil has been focused on the Vega Showings located in the eastern portion of the property. More recent work has identified additional gold/copper showings on the western side of the property, most notably the Pluto showing. Recent prospecting, airborne magnetics geophysical, and LiDAR surveys covering the property area returned encouraging results highlighting structural corridors which are prospective for hosting mineralized systems both in the east and west of the project area.

In September 2019 a geological mapping and surface sampling program was completed to investigate prospective targets zones on the Vega project. The field work encompassed a detailed "base-of-slope" sampling programme on 100-metre spacings within a core area that is approximately 6.5 by 7.5 kilometres in size. The area selected is within the western half of the Vega Property and was intended to complete "first-pass" coverage of a prospective tract characterized by several copper, gold and silver showings and intense rock alteration that maybe related to magnetic anomalies and porphyritic intrusive rocks.

Results identified anomalous and often high-contrast copper, gold and molybdenum anomalies, sometimes associated with strong magnetic anomalies. Three large "clusters" are evident, including:

1. Anomaly 1, which suggests extensions to the Pluto showing, may exist up to 2,000 metres north from the original showing. This extension has not been previously mapped or prospected;
2. Anomaly 2, downslope from a new 2019 mapping/prospecting discovery of outcropping copper mineralization associated within an area of magnetite-epidote (propylitic) veining in quartz diorite intrusive. A grab sample from this area returned 2.26% Cu and 0.145 g/t Au;
3. Anomaly 3, occurring on both flanks of Thane Creek close to the possible contact of Hogem Batholith units with Triassic-aged volcanic rocks. This area is reported to have several (poorly located) RGS Minfile showings recording anomalous copper and gold values. Prospecting and mapping along Thane Creek identified abundant quartz-sericite-pyrite and potassic feldspar+biotite+hematite -altered quartz diorite float as well as localized fracture-controlled quartz+pyrite+mica veinlets with trace chalcopyrite;
4. Additional anomalies are present within the survey area.
5. Areas of silicification, sericite-pyrite and feldspar-hematite alteration were encountered that are very encouraging signs of a hydrothermal environment for hosting porphyry style copper-gold mineralization.

Additional exploration is recommended. Exploration interest in the region of the Vega project has increased significantly since 2020. Several property option agreements have been signed by other companies, staking has increased, and numerous exploration initiatives are currently underway in the area. During the first quarter of 2021 the Company undertook a comprehensive review of the Vega project data, and later completed a limited IP geophysical survey over the Pluto showing, with evaluation of results pending.

***Canasil Resources Inc. - Interim Management's Discussion and Analysis
Quarterly Highlights for the Nine Months Ended September 30, 2021***

Technical

Robert Brown, P. Eng. British Columbia, and Advisor to the Board of Canasil, is the Company's designated Qualified Person in accordance with National Instrument 43-101 in relation to data provided with regard to exploration programs undertaken by the Company.

CAUTIONARY NOTE

Certain statements made and information contained in this MD&A and elsewhere constitute "forward-looking information" within the meaning of the Ontario Securities Act. Forward-looking statements are subject to a variety of risks and uncertainties which could cause actual events or results to differ from those reflected in the forward-looking statements, including, without limitation, risks and uncertainties relating to the interpretation of drill results and the estimation of mineral resources, the geology, grade and continuity of mineral deposits, the possibility that future exploration, development results will not be consistent with the Company's expectations, accidents, equipment breakdowns, title matters and surface access, labour disputes, the potential for delays in exploration activities, the potential for unexpected costs and expenses, commodity price fluctuations, currency fluctuations, failure to obtain adequate financing on a timely basis and other risks and uncertainties, including those described under Risk Factors in each management discussion and analysis. In addition, forward-looking information is based on various assumptions including, without limitation, the expectations and beliefs of management, the assumed long term price of precious and base metals, that the Company will receive required permits and access to surface rights, that the Company can access financing, appropriate equipment, sufficient labour and subcontractors, and that the political environment within the Company's operating jurisdictions will continue to support the development of environmentally safe mining projects. Should one or more of these risks and uncertainties materialize, or should underlying assumptions prove incorrect, actual results may vary materially from those described in forward-looking statements. Accordingly, readers are advised not to place undue reliance on forward-looking statements.

Approval

The Board of Directors of the Company has approved the disclosure contained in this interim MD&A – Quarterly Highlights. A copy of this MD&A and previously published financial statements and MD&A, as well as other information is available on the SEDAR website at www.sedar.com, and on the Company's website at www.canasil.com.
